Problem Statement

- Stock Exchange Extravaganza is a board game to capture the excitement and reality of making money on the Stock Market through main moves of Share Transactions.
 - This game of skill where no dice is required, only make your own decisions. It is also highly interactive as your decisions will affect the other player.
 - We aimed to apply the use of class, use of strings and the advanced use of most basic functions like loops, initCanvas, etc.
- 

RULES OF THE GAME

- ▶ This program is a one or two player game in which the user trades in shares of six companies for a fixed number of bargain rounds, each round giving a user three chances to trade. In each bargain round, ten cards are distributed to the player on each of which fluctuation of share prices of a company is mentioned.
 - ▶ The price per share for next round is decided by the net fluctuation for a particular company in the previous round.

Challenge

- ▶ We had to define each card, price fluctuation and net fluctuation individually, to display them using “Text” command in initCanvas.
 - ▶ After completing the basic operations of the program, it was difficult to perform switching of canvas windows and generate desired output on Canvas.
 - ▶ On discussing with our TA, we defined the name of cards, etc. as arrays of structures.
- 

Future Work

- ▶ We can improve the multiplayer gaming by the use of socket programming i.e. The software can be extended to a server or a network based software.

INNOVATIONS

- ▶ We have exploited initCanvas to its fullest use in order to get graphics for this game.
 - ▶ We have made this game with two modes i.e. basic and advanced.
 - ▶ Also the player can save and exit the game at the end of any round(only in basic version).
- 

THANK YOU
